Leaflet code: E-BRDA-09-299

Introduction

This leaflet has been written for carers who are supporting an individual with a learning disability, who is or may be experiencing dementia and has been referred to the local community team for adults with a learning disability for assessment.

This leaflet provides information on:

- What dementia is
- The assessment process
- The role of the carer in the assessment process
- Questions you might have about the dementia assessment

Dementia

More detailed information about dementia is contained in the leaflet, 'Dementia and people with learning disabilities: An information leaflet for carers'.

What is dementia?

- Dementia is a term used to describe a collection of symptoms caused by structural and chemical changes in the brain as a result of physical diseases.
- It can affect anyone as they age but people with learning disabilities are four times more likely to develop dementia than the general population.
- People with a learning disability are likely to develop dementia at a younger age than the general population.

What are the main symptoms of dementia?

- The symptoms of dementia include a decline in memory, reasoning and communication skills and a gradual loss of the skills needed to carry out daily activities.
- Although symptoms might be present already it does not mean that a person has dementia. Change and deterioration indicate possible dementia.

Contact Details

The contact details for our community team bases are listed below.

Wirral Stein Centre

Address: Stein Centre, St Catherine's Hospital, Derby Road, Wirral CH42 0LQ

Tel: 0151 488 8150

Cheshire West Eastway

Address: Countess of Chester Health Park, Liverpool Road, Chester CH2 1BQ

Tel: 01244 397 222

Cheshire West (Vale Royal) Wyvern House

Address: Wyvern House, The Drummer, Winsford, CW7 1AH

Tel: 01606 288 850

Cheshire East (South Cheshire) Stalbridge Road Clinic

Address: 54 Stalbridge Road, Crewe, Cheshire CW2 7LP

Tel: 01270 636 335

Cheshire East Rosemount Lodge

Address: Lea Bank Close, Macclesfield, Cheshire, SK11 8HE

Tel: 01625 509 013

If you have a query please contact the team at the base nearest to you.

Further information on dementia is available. Please speak to your contact person from the community team or have a look on our website www.cwp.nhs.uk.

Is the assessment different for people with learning disabilities?

- Yes. Dementia is more difficult to identify in people with learning disabilities, because of their lifelong difficulties.
- The assessments used are different to account for this.

Is there anything I can prepare in advance?

- You do not need to bring anything with you. However the assessment is based upon your observations of the person you look after and so it would help for you to observe them more closely before the assessment so that you have a good idea of their abilities.

The Assessment Process

What will happen if dementia is suspected?

- If dementia is suspected in the person you are looking after then they will be referred to the community learning disabilities team.
- They will be assigned a named contact person who will keep in contact throughout the assessment process.
- We will write to the GP of the person you are looking after, asking the GP to do a health check. This is to see whether there is any physical cause for the symptoms.
- If there are no physical causes for the symptoms then a dementia baseline assessment is carried out.

What is the dementia baseline assessment?

- The dementia baseline assessment is carried out by your contact person from the community team.
- It asks you questions about the person you look after and looks for changes in their behaviour and skills.
- It also tries to rule out things that are not dementia as a possible cause for the changes in behaviour, e.g. depression.
- Some part of the assessment are undertaken by you as the carer. Some parts of the assessment will be completed with the person you look after. The person you look after will be asked to give consent for the assessment to take place.

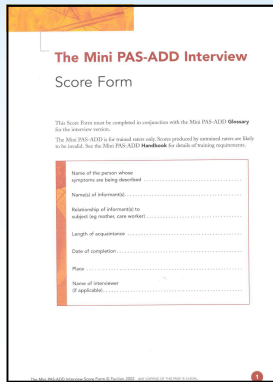

What does a dementia assessment involve?

The dementia baseline assessment uses four different assessments that will be described in more detail on the following pages.

The assessments are called:

1. The Mini PAS-ADD
2. The Clinical Interview
3. The CBSC or the NAID (dependant on the level of learning disability the person you look after is diagnosed with)
4. The DLD

The Mini PAS-ADD

The Mini PAS-ADD Interview Score Form is a document used for recording the results of the Mini PAS-ADD interview. It includes a title 'The Mini PAS-ADD Interview Score Form' and a sub-header 'Score Form'. Below the header, there is a small text box stating: 'This Score Form must be completed in conjunction with the Mini PAS-ADD Interview for the carer to use. The Mini PAS-ADD is a manual that will be provided by the relevant care team. You should refer to the Mini PAS-ADD Handbook for details of testing requirements.' The form itself is a grid with several rows and columns, each with a header and a corresponding input field. The headers are: 'Name of the person whose symptoms are being described', 'Name of informant', 'Relationship of informant to subject (eg mother, care worker)', 'Length of observation', 'Date of completion', 'Place', 'Name of interviewer', and 'Date of completion'. The input fields are represented by dotted lines.

- 'PAS-ADD' stands for 'Psychiatric Assessment Schedule for Adults with Developmental Disability'.
- The purpose of the Mini PAS-ADD is to rule out other mental health problems such as depression or anxiety as a cause for the behavioural changes in the person you look after.
- The Mini PAS-ADD provides statements, such as "appears depressed, sad or down".
- You are asked to indicate how much you agree or disagree with each statement for the person you look after.
- The statements cover a wide range of areas, such as:
 - Memory
 - Concentration
 - Mood
 - Sleep patterns
 - Eating habits
 - Social interactions
- The Mini PAS-ADD also asks how the person you look after might react in certain situations (including physical reactions) and asks about any recent life events that might have happened to them, such as moving house.

What is my role in the process?

- Since you know the person you look after best, you will be very important in monitoring whether their behaviour has changed, thus helping in their diagnosis.
- You can also take the person you look after to their GP for a health check, and can offer them your support through the assessment process.
- Once the assessment has been completed we will meet with you and the person you look after to discuss the results and what they mean.

Questions you might have

Where will the dementia assessment take place?

- You and your contact person will discuss the best place for the dementia assessment visit to take place.
- It can be at the community team base or somewhere that suits you.

How long will it take?

- The length of time varies greatly between different people, although it does take several hours.
- It can be done in one session or several, depending upon your preferences. You can discuss this with your contact person.

Is this the entire assessment?

- If the dementia baseline assessment is not enough to establish whether or not the person you look after has dementia, then more assessments will be carried out if the community team feels it is necessary
- If the person you look after has dementia more tests might be carried out in the future to monitor changes.

How often will the assessments be carried out?

- The baseline assessment results might not tell us whether the person you look after has dementia, but will tell us their current level of ability.
- If you are concerned that the person you look after has dementia the assessments can be repeated after 6-9 months.
- Comparing the scores will show us changes in the person you look after, and what areas those changes are in.
- If you are not immediately concerned that the person you are looking after has dementia the assessment results can be stored for reference in the future if concerns arise.
- If the person you are looking after has Down's Syndrome we will invite them for repeat assessments at different intervals depending on their age:
 - Aged 30 – 44 years old – 5 yearly
 - Aged 45 - 51 years old – 2 yearly
 - Aged 52+ - yearly

What will happen after the assessment?

- After the assessment, the team will meet to discuss the results of the assessment. We may then invite you and the person you look after to come in to discuss the results with your contact person and our psychiatrist.
- If it looks like the person you look after has dementia, a diagnosis of 'likely dementia' is made, and we will discuss the options for treatment and possible types of dementia.
- If it looks like the person you look after does not have dementia, then we will discuss the options for monitoring for future changes, and we will discuss the possible causes for the problems that caused the original referral.

The Clinical Interview

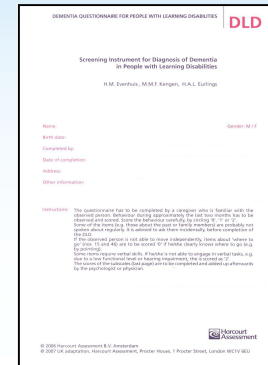

- The purpose of the clinical interview is gather information about the service user in all areas of their life.
- The interview is completed with family, home staff and day service staff so all areas of the service users life are discussed.
- The interview covers topics such as:
 - Accommodation
 - Activities
 - Routines
 - Personal care
 - Support
 - Communication
 - Behaviour
 - Mental health
 - Physical health
- The initial interview completed during the baseline assessment gathers information about the service users 'normal' routine and support.
- If further deterioration is noted an additional, more in depth, interview is completed allowing family and staff to explain the changes in the service users presentation across all areas of daily living.

The NAID

- NAID stands for ‘Neuropsychological Assessment of Dementia in Individuals with Intellectual Disabilities’.
- The purpose of the assessment is to assess the service user’s current level of cognitive functioning.
- Tasks include: naming, picture identification, orientation questions, card sorting, object memory, picture memory, performing actions on request and memory for sentences.
- This assessment takes approximately 1 hour however can be broken down into individual tasks if this better suits the service user.
- If further deterioration is noted the assessment will be repeated and the initial scores will be used to compare against to assess for changes in cognitive functioning. If noted, these changes will be discussed with you following the whole assessment.

The CBSC

- CBSC stands for ‘Cognitive Behavioural Skills Checklist’.
- The purpose of the CBSC is to provide a clear picture of the current daily skills of the person you look after and how they have changed so far. This is used for service users with a severe/profound learning disability.
- You will be asked to tell us what support the person you look after needs such as with eating and dressing, and how this has changed compared to how they used to be.
- This can tell us straight away whether you think there have been changes and where they are.

- DLD is the short name for the ‘Dementia questionnaire for persons with learning disabilities’.
- The purpose of the DLD is to monitor dementia-related changes in the person you look after.
- The DLD provides statements such as “knows which month it is”.
- For each statement you are asked to respond with ‘yes’, ‘sometimes’ or ‘no’.
- The DLD covers a wide range of behaviours and cognitive abilities such as memory, orientation and mood.
- If further deterioration is noted the assessment will be repeated and the initial scored will be used to compare against to assess for changes in cognitive functioning and social functioning. If there is a significant change of score this may indicate a dementia related change. If noted, these changes will be discussed with you following the assessment.
